IN THE SPECIFICATION

Replace the paragraph bridging pages 1-2 with the following:

--In one known file system, it is not possible to use a specific set of characters that includes the question mark '?' in a filename to name or identify a file. Since the set of illegal characters is only specific to certain file systems, other systems can create files with illegal names. If an illegally named file is received from another device, the file will typically be rejected in the receiving device due to the illegal name. If the illegal name is simply converted to legal one, the illegal characters in the illegal name will be lost. If the illegal characters were important to some other file system, the file is permanently corrupted and cannot necessarily be handled in the external device anymore.--
